axuall
Axuall enables healthcare leaders to optimize their most important supply chain: their clinicians.

When you think about big data in healthcare, you tend to think about patient data. But what about the big data associated with the people who make the healthcare system work, the physicians and the nurses? Axuall's workforce intelligence solution connects hospitals, health systems, staffing firms, large practice groups, and telehealth to clinician big data to streamline onboarding, recruiting, and planning processes. Axuall's solution saves time and financial resources by providing ongoing monitoring and optimization of clinical workforces while also reducing clinician burnout and improving patient care.

Clinicians require initial credentialing and frequent recredentialing to ensure patient safety, a vital responsibility of all healthcare systems. However, the staffing and onboarding process sidelines doctors for an average of 4.3 months, costing health systems over $500,000 in potential revenue per open position. Axuall supercharges the ability of health systems to sort, collect, and transfer a clinician's data significantly faster than a traditional credentialing system.

**About Axuall**

- 70% reduction in clinician paperwork and turnaround times
- $74k captured in potential revenue per clinician through accelerated processes
- 90% of 9 out of 10 surveyed clinicians would recommend Axuall to their peers
Axuall's workforce intelligence solution gives hospitals, health systems, telehealth firms, and healthcare staffing agencies access to the data they need most – whenever they need it most. While onboarding traditionally requires extensive manual entry, routing, and monitoring, Axuall's workforce intelligence is live and accessible 24/7, empowering administrative users to seamlessly request, access, and manage secure data across all employed and affiliated clinicians.

With its workforce intelligence capabilities, Axuall provides data-driven tools to enable administrative decisions with ease, streamlining credentialing, privileging, enrollment, network design, and planning processes to reach organizational goals—this accelerated process results in real cost and time savings.

Further empowering those that matter most, Axuall’s clinician wallet allows clinicians a single, web-based, mobile-friendly tool to manage their credentials, licensures, and career achievements—at no cost to the clinician. Able to be shared from facility to facility, the clinician wallet features pre-populated forms with verified information, reducing the time for initial credentialing and recredentialing from months to mere seconds.
Charlie Lougheed is the CEO and co-founder of Axuall, a workforce intelligence company built on a national real-time clinician data network that enables healthcare organizations to create more efficient care networks while reducing onboarding time by over 70 percent.

Charlie co-founded and co-funded Explorys, now IBM Watson Health, in 2009 as a spin-off from Cleveland Clinic. Explorys became the leader in healthcare big data and value-based-care analytics, spanning hundreds of thousands of healthcare providers and over 60 million patients across the United States. Having amassed the world’s largest clinical data set, Explorys went on to serve the payer, life sciences, and pharmaceutical sectors by providing real-world evidence and insight for product planning, research, health economic outcomes research, and safety.

“The growth we experienced since our inception tells us that being the connector to clinicians and their data is important to the ecosystem of our customers, vendors, and data partners. We are humbled and honored by the support from the healthcare community and forward-looking investors as we address this opportunity to improve access to quality care.”
Axuall is backed by cutting-edge investment firms and industry-leading healthcare and provider organizations. These partners support Axuall’s vision for reducing waste and creating efficiencies through innovative workforce intelligence solutions.

“Provider credentialing can be a 10-month process in healthcare. It is a metaphor for all the brokenness in healthcare. It is a real thorn in people’s side, for financial executives as well as for the actual providers.”
